Generator Connect Package

- Interlock Kit
- 30 Amp Inlet
- 20 foot Cord
- Installation in Your Home

Convert your home electrical panel to a Manual Transfer Switch, with an InterLock Kit.

What is a generator *InterLock* Kit?

The Generator Interlock Kit is a product that allows a portable generator to be safely and conveniently connected to a home's electrical system. The design of the kit provides the necessary protection to keep utility workers safe while the home's electrical system functions normally from the generator. This is achieved by providing a mechanical interlock so that both the utility breaker and the generator breaker cannot be turned on at the same time, which isolates the two systems.

Safety is also improved because with the Generator Interlock Kit installed; there is no need to run extension cords into the home, which eliminates associated fire and tripping hazards. The interlock kit is wired to the 30 Amp Inlet Box. This box is mounted on the exterior side of your home. One end of the 20 foot cord plugs into the box and the other end plugs into the portable generator.

Our kits are designed to be installed by qualified electrical personnel and meet the strict requirements of the National Electrical code and the National Fire Protection Code.

We offer kits to fit most electrical panels and a full line of accessories to help you connect your generator to your home.
